EXPERIENCE

General Motors February 2021 - Present

Software Engineer, Data Governance (April 2026 - Present) *Austin, TX*

- Built React and Django internal web application that automates Databricks onboarding — users submit forms and the application executes Databricks API calls to provision workspace access, create Azure AD groups, and manage group membership
- Administer Databricks platform across multiple workspaces, including user access provisioning, service principals, catalog permissions, external volumes, and Azure storage integration

Data Engineer, Connected Vehicle Data Engineering (April 2025 - April 2026)

- Designed and deployed event-driven data collection systems, processing real-time telemetry across GM's connected vehicle fleet
- Resolved production data collection failures for rental fleet partner (100,000+ vehicles) by implementing direct read method to bypass queue bottleneck, ensuring accurate fuel level and odometer telemetry
- Developed Python ETL pipeline migrating CSV/XML configuration files from Git repository into Databricks, enabling PowerBI analytics for deployed data collection programs

Software Engineer, Big Data Engineering & Infrastructure (February 2021 - April 2025)

- Developed GM's custom Hadoop distribution (GMDP) by integrating open-source components including Tez UI, Ambari, and Livy, migrating from Cloudera and reducing annual costs by $1.2M
- Contributed to Apache Ambari and Bigtop open-source projects by implementing Livy service integration (Ambari PR#3790, Bigtop PR#1282)
- Automated Docker-based Hadoop development environment, reducing developer setup time from 35+ minutes to 10 minutes by eliminating manual build and deployment steps
- Responded to Log4Shell vulnerability by developing automated remediation script for production Hadoop clusters, integrating into standard startup process for ongoing protection

PROJECTS

Coaster: E-Ink Cycling GPS https://paulyakovlev.github.io/coaster/

- Designing and building an ESP32-S3 cycling computer with a 200x200 e-paper display that records rides from GPS and barometer sensors to GPX files and uploads them to Strava when it reaches home Wi-Fi

Real-Time Transit Data Pipeline https://github.com/paulyakovlev/muni-tracker

- Python service polling the 511.org transit API every minute for real-time San Francisco Muni arrival predictions, storing them in PostgreSQL and visualizing arrivals and route maps in Grafana dashboards
- Containerized with Docker and deployed to Kubernetes on an Oracle Cloud server as a scheduled CronJob alongside PostgreSQL and Grafana

EDUCATION

University of California, Santa Cruz 2020

Bachelor's Degree in Computer Science

SKILLS

Languages: Python, Java, C++, Bash, SQL, JavaScript

Technologies: Node.js, React, Django, Docker, Kubernetes, PostgreSQL, Databricks, Azure, CI/CD
